## The Hidden Connection

 Between Nutrition and Childhood AilmentsKELLY DORFMAN, MS, LND

Forewserd by Richard E. Layton, MO, pediatric allergy specialist

## The E.A.T. Program: What It Is and How It Works

IMet Makco vien me was alwost Eliven. He wis of normal wighe, but atr only thase foods (pasta, yogart, and bugelo) and had bepun to fed axivard tocially because of his wery limited palate. His puenta had viuited sereral poychologoses and doctors about the pmblem, to no avail. Wheller or not Marco world amesd an event had nirt to do wilh ibe food being served flun the astivity itelf-be was nerwos thut someone would ank hiar to try soenrething. If he was invited so apary, he had so check abcid so make uer they'd be serving a food that Ield eal. Thin is not su rarr a tituation as you mighat think.

Mancestylained veny hosestly that be wanted so eat more foodu and ivyaer thigg, but cooldr't get himself to do it. Juit whing aboor pranut bunrr brought sean so hive eyea! Hes parents wanted to help becouse they warnind that in the seengeg yean his cating habin would become an event Inarr social liabelity. "If oely pixas was one of the three foods be ats," they lamemed. His parena admitted they had finally jan thoown up thir hands in defeat, figsaring he would eventuilly grow up and perhups wounnsoully decide to try new foode thin.

In my menement I pided out ewa cluat to bollowi inc, Minco wes berally diguted by renny foodr; and two, alhough he had become very
 change this amnude. Becauve soreary food hlyyuted him, dae mamberoee made me think abour zinc. Chiblern widh a deficiency of the muinenal rine can become alnost tepelled by the tates or imells of mary foode. Marco's "white" der did sot contain zinc (and many other mivenhlds people with lov levels of zine can lose their senses of mell and taite er huve those vemen itered, tauuing then ts operiater notmal foodi in unplearant or unumul waps So the fint lling I did was put Maco on a multivitamit with rinc to improve hin ernic of tate and enell (Ser page 112 for mone iaformatios on tevang of aine levela) Hecause of hir poor diet, his mother had been giving him a chewable bid' maltiviamin for peas, but it had oely 2 milligams of rinc. The sapplement I wogested pronided a beter spetrure of minerale and, mort importane 15 miligrama of xios.

In response to clae number twa, 1 had him take a specially foemulated finb oil to addres anoiery. Many stulies have demonumaved the positive effict of one of the las in fish oil (called EPM on axiety, mood, and behavior Marco's limited diet was completely devoid of buisic ciarstial fits, induling the omega-J fars sound in fish and cewved. Fath are structural natimenthat affect the way the traio operate and are calring If we could not belp Marco reduce lis emotional stras anound eating wo were not going to be wacrevful at introducing new foods. You will rad the detail of how owepr-3 farty acih affect amoley in chapter is.

Tos support him furthet, we pur together the "one food, ose Bitr" plan for inuodecing new foods. I aked him, "Do you think it woold

Children with a deficiency of the mincral zincican become almose repelied by the tastes or smells of many foods. be porsble to try just ose bite of the same food every day foe a fow weclo?* This is a good tectnique for prting eetremely pidy ewen to change theit hativo over time. Generally, I Intabolewerna choone the new frod or try to choose
a bood vimilar to womething thry alrady cat. Yourger hide need mone Amptien and iden. Try to limit your food sugextions to two no the child best overshelmed hy too muny doice.

The foods Manco wanned to leam to cat, voch as perra and humber: m, wese too irtimidatitg to surt with, so I mpgeved ratiahich. This is an maual fint trial food, bet ralithes are mondy white and have a atrong farci, and Marco had no emotional kiatory of thoughts about theme Marry other sbreapivs had reied and falled with more tralitional bland foob woch as applesuce and adding dheese to hin paita. I figared the notihes were worth a try.

1 wamed Marco that he vould probubly pag the fint several deys and
 tane bine of a slice of nalish for troy weeka. And he did! Marco did indeed sas and shake cerry dey durieg the firu week whom hes put the bine of food =so hin mouth. Thekey to hin raccess was bused on both his urviving the
 I nald his paent they lad so suy aboolanly caln and tell hime be could do it even though be was urngling like crary: Repeating the vallil no trini (ane bief gradaully briped him develop a healtty acclimution to eating trew foocks Slowly, though the fint two wrels, lie gew socenomed whoth the idea of trying a sew food and the egeriencr of exing a new food. He did not like givesing, but tabler than seeing ir a a signal to wop mondiatrly, he suw it as soesecthing be could ovectome. By the end of the monh, he raroly retched when uyirg see food. I often amind parens that acclimution will happen, but that it cin ube time and effort.

Marce and lis parests srack with the program, sot stopping with uee mopeufal food, but uning the poritive experimct to contime mmodaring new foode. It tumpd ose that Mare had spent a lot of time "wishing food," and when it came time so try be nent frw new foodu, le chowe them. Mareu ended up liking (and eating) duck hamburgers, and musandt He did not like sadinhes but overall prefermed atrong fla ron-chowing thar not all bid prefir awoet foods. With his peefremore in mind, wr looloed for other foods wo wwiken his tate buits.

## THE E.A.T. PROGRAM

Itrprovingthe diet of a picky eater-or amy child licling in nutrients-b difficult but necesary and posiblle. With both Tom and Manco, 1 followed the claen that their beluwior and diet wew mgeasting eliminated imtants when necessary, wated bor or helged the boy to calm slow and feel berrer enongh, and then began adding foobl and ocher vapplements to further improve their nutritional tates and allamund healh My busic atrategy, and one thut I have succesufully used with handrods of pichy eaten, is denignated by the acronyen EA.T. Follow it, ind befoee you know in you will have a child vbo ...eate"

E- Fliminte any itritints that may be camiog a bad raction.
A-Add one food at a time.
T-Try one bise of thir food each nighe for two wooks.
The havis of this program in that kids need time to get used no fooch thar are unfaniliar or otherwise diseateful. Food peefentenct develop throuph a proces of acclimation. Prople ger weed to what they huve been expoud to and tend to prefer the known. Thus, Irihl people tend to likr potatoes, Chinese people eat rice ruther llan bread with realk, people gowing up in the South ent tamips, and to on. The observation is not an attrmpe so defend cultural atereotypes but an ackeomiedgnese the prople tend to like what they lnow

You can't expect any child to embeace a food at firu glaner, never mind first bite. In Mesico, tnothers pur hot sasce on babien' Ips at sine months old. Of coane the habies ofern wovel, bur the mothens persevere, becasse eating food spiced with hot peppen in purt of theit cultural diet and childsen need to get used to it. In the United Stams, we shy awny from this kind of training. If Miley doein'? like the first laste of pean, we annoence that Mikry does not like peat and send not to try them ugain, so Mikey never has a dunce to aprally grow accustomed to peas. He brcomes a peaveoiding adolescent (or a broccol-hating president) Should ten month-old children rally make that decivion? They offen
do in Westem calnures, and we have an epidemic of pidiy eaten in thin generation to powe it.

Reviting the urge to oupond immeliately to a child'y initial dislite of a food takes a lot of potience on the part of parnts and carreperan. And alhough the E.A.T program works, it does require you to ntay calm, cool. and collected and to pernerer. Doo't stop after ene success or failereinep going

The EAT. $\mathbf{~ - ~ w o g r e s ~ w o r k ~ l i k e ~ t h i s : ~}$

1. You Eliminate any irritant, or in some case anheality food, from pour child's diet.
2. Yoe teplater to pore child that for the nest reat work, he is poing to Add one new food, (Wou help your child decide on thin food, miking it nomewhat similar in textere, colot, of taste to a food he already enjogns)
3. Yoe thers ruplain that all yoo ate anking for him to do is Try one bitr of the new food. He will be tryigg core bite of the sane sew food rwery day foe tro wrela.

Ore mother frought her seven year-old daghoes Claodia, to see me becasae she and her hrabund were hratsick with worry abour Cluada's pidenes around food. Like many dildren, Claydis ate everghisg unel she was rwo, at which point her dizt was redeced to yoer typical lide' senw panciles, cookies, sugard cereal, dhicken nugerts, mac-and-chese, poras. No fruit. No vegerables. No froh. No whole grains, legames, or mond dithes. She was extrenely semuive so smolls, often conutipated, and had mouble going to aleep. As an only child, Clasdia lad all ber parents' atartion; she became hyserical when anked to try 4 new food, and her parents badked off immodianly.

We all know that food and eating ppovides obe of the fint and moer stabboen bunkgroundr for bide, which makes setis, developmentally. At woo yean old, most bids sotice that when they do something, they get a maction. If they por a secaler in tec toikt, it makes a fien nound trying
so go dows the pape, Jin't that interrating? They begio to wonler what thee they control, becasse clearly there is sone conesol to be hail. This is a normal purt of developrarnt.

Very frestrating for toddlers, mour events seem to be under the coetrol of the big people. The giase foece then inno car irati, shove them into voollen, and put them to bod when shey don't want to ph, and there is sot a darn thing they can do about ic. Scraming does not seem to help very much. Bat, what ia this? Clowe my moveth ind the food goes away? Finally, sosicthing a moyeat-old can controt. Thir in why so many kid are wach good eates until age two.

Unithe Then, whon we met earfier, Clandia was sot moody of difficslt, oor was she sick often though she was often contopatedi. In fact ile was a vweet limie darling belowed by both friends and teaden. Howerce, her mother began to panic whes the tearted gertiog reports from shool abour her deteriarating anetition span. As the demands isctesied, Claudia was not able to follow directions and tecmed to be increasingly in her uwa world.

In this case, the firut clar 1 sollowed was how caily upect Claudia's parents becase: They patickal right alongide thrir duphter when the serugeled with cating. I figund that their reaction wav not helping anyone. We reviewed tbe E. A.T. program, and I gave Claodia's purents their manhing ondens: Clasdia coald leam to eat new boode, but diey would have to be able to tolerane lier initial disues when trying a new food. Under so circumsance wret they to stop trying a new food jait becaure Clauda found it difficuls.

After three viits, over three nontls, Clasfia had not only begus to eat the "one bite" hut had discoverod sume heally frods she lied. The reporst stoppod coming home from school, and as ber diet contirved no impeove, she began to liuten betuer and follow difectione betert, and overall seened mote alert and sentirnt,

How did Chudis improwe so quiddy on the E.A.I. progam? Ste dd not have imitants in her diet perse, but she was connuming a bet of empty calorie. It is aleaps easier to alwinas junk than to ald healthy
foods. Therefors, for the firt utep-FIminabr-I supsated removing the woes of the empty calone jusk foods from ber diet becasse they wote adding to oumbional value, bot wese taling -p stomach vpack. We climinated wagary beralfast foodi and drwerth.

Ar the second mep-Add-we added rges and ilen cumos fone it 2 timet. Wte aled lier wherher sbe would rather prastice cating egp or chicken for the firt food. She was too zpuet to atvwer, wo her father doove eges and told her she could pisk the second prictice food. Once the one hitr of cge was tuken every dey for two wedk, he offerod her a hoicr of tra vegctables (camoti or lestecel) She pidied carroth.

For the thind upp-Tny-herparents sold ber she needel so uy jest one bite of the practice food she tried the bike, but only after a couple of dern of howling and copicus tran. Her parmas did not jamp to ber nocoe as She erpected but ataped wrangely calm and evcounaged her so kees going. With nothing ebe to do, Cliudiu bepin so ory the "idy" new food.

When she tapped mlying on an empercaloric bid diet made up of low-fiber white foods, which was leeping her contipned, which in turn lopet her from sleeping soundly, ler system rrgulated withit a couple of wecka.

Sound simgle? I in. Hevery why
How maty times his a pareot lamessed, "1 jast want him to cal sownshay" to jurtify a diet of junk food mealh, cookies, and ice cream? Althoggh it tales time to ortrain your child's besin the main obstacke to his srying and enforing a vaciety of foodex, it is enry so ube rway the wore of the rapty calorics. Ma chidd will eat only peanut butter and irlly andwiches and dessers, then eliminate desem. Beteer so eat peanar bumer and jelly three tines a day than to have only one reil meal and the teit of the diet be fi太er noafoods, like criden and ecolum.

Thin tingle uxp can improve the Jet 100 percent. |loods thur consin calooes but art limined io nutrients can be dangesous whes a dilid is a pidig catter. Nature in not wasefal. It eapocts all of your food to contain some of what you need. A peanut booter sanfwiht has nome of the nutrients yoe need for the day, but if the set of the diet proviles

## When Trying New Foods, Go for Something Familiar

Sowe uperts call ivis food chaining. The periciple is fuat the new food whould hwve nome charscternice of allood aheady sates il a chibjeans only mushy foodis you mould not piek a crunchy canst as a triai Atem. Ack nomothing wht a limilur color and lenture et teve and colloc. Hers are nowe exavplay:

- E pour chidd loves french lives. try fereet ponato trise.
* It ine likep the onunchiness of chps, ty laked or freem died nogniables
* It he llas onchens, ty mutigam orackers.
+ I helass sob mac-ard-chesse. Vy mquash soup, which is oreary in leahes.
almost no merrients, you heve a siration where a child in trying to pow and leath on perhapi 25 or 30 pencras of the nutrients normally required.

Sagat, in particulat, han been proven to be as addicting as beroin in some people (and cervinly in rath. If cookies and ice copam *ere nutritionally complets, there would be no woch thing as pidy eater, because moat of them love wowth. Those who don't llave a sweer mooth send to prefer whing, itarchy food such an patis and bread. Intrratingly, in more then rwenty-five yean I have only onct had a paernt expres coscers about herchild because he wanond spinach every dax. I assured the masion parent that the choice was noct a problem. If your child retuser chips bot iestats on broccoli oe green beans, give thia book to someone elor (or at least akip this chapter))

If yoe cur out the jurk and your child geti bored eating puixa three times a day, dien thar is an opponanity so introduce a new food.

You heve to kerp introduting new items so your pidky eates, trusting that you will find one he liles, and you will. Mont parenth have "tried" to the poist of bimer frustation with no real progres. Smcressfil food trials require you to do the following:

- Give the child a choice of two foods to try so he sill has some conerol over eiting. If le refuies to droove, tell him you will pick she
fins one and he can pick the seceed. Ketp chooving for him until hejouns in.
* Choose a food with some familar duracteristic and try it at one meal or anack time for rwo weeka.
* Intsodace each food one by one.
* Be consittrm, Irting yoer chat aoclimate to the coe food foe teen to founten days
- If pour child tolerates that food, keep it as a standind offering If he doen't tolenate it, affer two weelo, choove another food and discoatinue the fint.
- Provide incemive: Let your dild $\mathrm{l}=\mathrm{ow}$ that when he is finished with his one bine, he will be able to wath a favorite peogram, play outide, gr enjoy tome other reward, depending on his devire. When trying to figure ost the incrntive that will workbent for your chld, ank youncli, Why should ny stald dhange ber behavior' If everything says the same and noeling happena if she does not cooperate, why thould she? The beat consequences are lopical and follow naturally; "Whm you finish with this, we cin do that."

And remember, it's olay to let your child strugse with the job of taking one bibe. Abowe all, ermain calmand heep introdocing new foode

## TIPS FOR MAKING E.A.T. WORK

Yrou huve to be consisten, whish means one food at a time over a period of two werka. Pioky caten doa't like food wiprises. Knowing thery will be dealing with the same sew food for two weeke holpe them calm down because they ase foecwamed. They meed to be exsed into a sew eperience. Anticty about the new is ondoced with feequerts topetstion. Tell your child that she will be making one "ery" bise of whurver food yuu choove. Kerp in povitive. Pronide be food ewey day for at least

## When Picky Eating Means Somything More Serious

spwphome thet buggest fiers are underfyig peotleres with Be abillty is eat that nevel io be udiressed, espocialy telore berting the IA.T, progranincludo pe following:

* Excestive dopoling
* stid hae never progensobd pant beby focd testares: montly evb mully focdn
- had new midy toweith
* id darposes of menerory prooesing daitder, mithis, or encentive sensory reactons so miry shatione bepond aviling
- child taksan moch longer to ean flat ievers nomal
* chid pags or manits trequertly
* evild pockete food in the cherebs
- exild cuexphens hequerthy of atomachaches
- ehlid whmer to kouch moet foode or ol at a lible obrtaring neve foods

Hjour thild eahbis ary of these oy-plorts, I iecortrmend thit yoy seek a heath careprolensionals achice before attengling new ibode ir your child doese nop nive anjof Bese sprpotanat but par ave still uncertain pet hole.
ten oo fourteen dayn After a fow werks, the child will be familur mith the food and will like it or noe Even if childen tolemter the new item, they fouy not requent a lager seviag Sall, the new fogd in now in the childs bet. One chilill worked with was as tubbom as they come. At right yean old, Grace att only chicken nuggets, paita widh baterr, med orcaionally. piza. The mochet was resipsed so the situation, but ooce the oboeved that her dsughter war poeting on wright, he decided to get help. We went through a typical line of quotioning to follow the clues, =ed it became dear that much like Cludia, Grace wat luching in both evential faty acids and zinc.
 added there new fooder romaine letruce, fith uticks, and apples. Ar my uggruson, her atother abo give her fish oil mpplemenn asd a maltivtamin with zinc. As Grace mocnuly said to me, she doess't heir the fiub
itick she tried, bot she now cats them wichors a foss. "They're not my Gwonte, bat I likt dem enough" was the comment. You don't تat jour givorite food erary might, night?

With Crace, as with mout chuldren, it wa acclimation and inaintence that woked. It abo helped that her mom wis convivent and calm, and iet up clear coutioquenten. Coniequences ihould not be prowned as a ewand or a punibhent; ther are the nexs thing that huppens, elish is being controlled and ariculased by the parent, la the beit scenaria these in a seguence that follom lopically, ach an, When you ane dope euting pour bite of squaih, then we can go octovide and ploy." This in quite cliffermt than saping. "If you don't eat thut squah, thest will be no playing ouside tonighe" The seap chatgo how you and the roult alir peocrived by the ctild. To anoid control isuss with fool, pou should be noither a puninher nor a rwader. Allow the natual oensequcses of the drild's, dhoices (alich ate being orchestrated tor you) to be the inceotive. The thoice to eat the squash moass thene will be sime to ploy ousside, while procraatineing and cryug meam there will be bo time lett for play. If pow present the situation with is fewasd or penithement at the end, pou poition goranelía an alvenary rather than a vepporver.

Most picky eaten will not realily atempen ses foods unlen there is a pood reason to do so. Thus conseqsencrs becomet the tipping factor. What happers when the limke one does not coopetate? If when she pithhes a screaming fit yoe waccumb and renove the food and give ber something elic, she loms that pitshisg a fit deatly morla's

I've said it befoes, and I'll say ie again-the mose important thing in for puensts no atay ader as thici child goes through the sennory diutien of teging a wew food. Yes, your chlid mifht cry a liek bei-it'solay. Inatead of froling iato her paric or aervosumen by bocoming nervous fourself, be raunaing. Ves, the teature of the momano feels different, yes, the sed pepper has a slighly spicy amell. Refer to thr Lat time your chill tried something different ind temind her the can be uocrufal.

Howeves, explanation are not a wobuitute for a calm peesence and logial consequences. Or is they say in the Ean, tall doen not cook the
rise. Most children seed a reason to makr a changr, and the beat reasen in a consequeste. Ont could ague that mout prople will not take on difficult tala without a consequence. How mamy of as woull bother doing the verp hand athing of writing a check for oor taxes if thene was not a consequence for fuilure so puy' The parent has so pwovide a ressoe for the child to tudle the had process of eating sev foodr. If pleating Mom were enoegh of an incentive, the child world not be a fuasy rater. The best etesequence, because it follows sararally, is not starting the nest desised activity antil the child is maly. Ronly is defined by the parm an the child firinhing the one libe of the ness food.

The evening') activies seed to be kegt os hold until the child's iob (i.e., taling the one bite) is done. Pratologists call this tedinique aben/ them. "When you are finithed with your dimnet, then you can purn on the computes." This is perferable to "If you would only eat your supid green beams, we could po so the palk."

Again, ift oklay to let your dild atruggle as he trien to take the one bite. Don't run in to caiole, msove, diveract, or poth. Life shoeld not meolve around a chld fefusing to eas. Pay you tills. Call your nster. And occanionally, semind your chuld that you are ready 60 tum on the TV for whutever the next activiry inj when he is finiabed.

When in comes so food, we forget the lasons we know from esperience: We ase able bo suffer through a child's temper tantum. After all, we wosldn't hevitate to rick to our gens if our child therw a fit that endangeerd his safety. Foe many of us food represents love, so making demands aboat it is uscomfotable, and parents have a hard time calming them-
 believe that having any bonselbold rule about food will cane an eating ditiordet.

The woet thing thet mill happen if you meat that your ctild wakr a bite is thut the dild will throw up. And if that') the casp, then venon to whit I call "the Mery! Severp sobool of acting." Fietend nothing alarming has occurnd, put on a straight face, and say, "Oh, deat, the food fell out. We'll just heve to try thes again tomomove" Mour child needr to lowow
that throwing op is not what ube han to do to itop the peogram. Howevet, If your child continues to throw up reveral days in a row or developn evcalating behwioral problems, you muat have a profevional eating exaluation. (Soc "When Fidy Eating Mean Sompthing Moee Seriou" on papr 58 for further infoemation.) Some chibiven literilly do not hive the phywal shilh for enay chewing and swallowing, ith the introdection of nev foodrican ciase panicatracka. Efat any poiar you feel the sinuason is grtting out of hand, contact a iqpech therapis, occupibional thersphe, or cther profevional with training in enting, chewing, and wnocey isues. She will wath your dhid eat and determint if there ane undetying peoblens that shoold be adfreutd before uning a sreoctured behavioral approach. I huve several therapists I refer putients to foe thix purpone, and it it moprining bow ofien lide have a developmental quirk that makes the process of titing difficul.

Bornowing from the welevision poycholleripit Dr. Phil. hrov is a ample script for waling through consequences. The serpt begina affer a food his been decided upon and the child is refusing no eat it.

Mothert An avon as you ane finiched ewies your ote lise of canot, I vill read yoo anocher dupter in yoar dagon book.

Child: I don't want so eat a cirrot toeight. It hat a spoe on ie. I will eat another carrot momesow.

Mother: I sec you ase note realy to read yee because you hives't fisinbed poer bite. I hope you finish woos so we do not rat out of time no mad before bed. Let me lnorw when you are ready. I will be wathing dishes over bere.

Child fafter glaring at the carrot tad kicking the table log for ten minanes)! I hate cartots, and I don't care about mending noy stapid diagon book.

Mothen Thit is too bad becaus I vimted to leow what buppens neat, bat if you do oot finith in time for nuading tonighe we can alvay try again tomomos:

Child (now crying): It is too hand, and 1 will mever finiah in time WAAAAAMMA

Child: WAMAMA?
Mother: Act you finithel ye:

Mother: Goodjot. Let'sporend.
Oeve chiltere vet that the pareit io not racting and moituace in futile, they unally calm down and art the job done, uniles thest are oshre underlying problems. For the most part, by the thind ness food triat the hatir of trying a new food in gouing cotahiahod and there io less reso
 tuke one bite. Uf the child becomes inceraingly hysterical no muter bow

## Every Child

 Should Take a MultivitabinFor poog robalmurv and optimal hearth, all hids thoold take a mohtiatarin on a delly basia at twent, prat leant iwo or three limes a mopet. Dut noil alt hids' mulles ovetais enooph of fie minerate and vtaniess pou are locking for Mout ingnedients is achid'n msetwiturin art mancuned as a percertage of a Eyetericup itundart called the Daly Walue (DV). ## SUPPLEMENTS TO SUPPORT A PICKY EATER

Nurritional mpplemeriss can close the gap bervect what a dild is milling to cat and what she needs for brain development. Picky vating can be a vicions cycle if a chuld becomen significandly malnourished. Malnutrition itwelf can lead vo pidy eating and mote malnutntion. In zise defoiency, for eximple, tater becomes alkeod so that food tantes bland es anelh "off:" The child then matrixs the dict furber, leating oo mose severe nutriticual iebalances. (See chapter 7 for more about zinc and appetive) Low levels of ather mutrithss can aloo nceatively affict the deuire to eat. Mout pioky eaten, who are thiter or oldect even if they
